Beyond Management ... From the River Styles Framework to more-than-human geomorphologies

Gary Brierley (School of Environment - Te Kura Mātai Taiao)

Formally acknowledge Kirstie Fryirs, co-developer of the River Styles Framework (Macquarie University) and the Let the Rivers Speak team at UoA

10th June 2026

Natural Channel Systems Conference

ACKNOWLEDGEMENT OF COUNTRY: LET THE RIVERS SPEAK

I'd like to begin by acknowledging the Traditional Owners of the land on which we meet today. I pay my respects to Elders past and present

Waiata from Aotearoa

Te aroha

Love

Te whakapono

Faith (hope)

Me te rangimarie

Peace

Tātou tātou e

And respect for all beings (For all of us)

Kia ora koutou Concern for collective wellbeing

Thanks

- Organizing Committee, especially Christina & Cailey
- Kirstie Fryirs, co-developer of the River Styles Framework
- Postgraduate students, colleagues and collaborators
- Elli Papangelakis

External perspective ... an outsider

Things I don't understand

- Natural
- Channel
- Site versus watershed

Mindset

- Nature fights back ... eventually it wins
- Thinking like an ecosystem

**How do we
know rivers?**

**Christopher
Pease (2005)

Publishing

How does the River Syles Framework differ from other approaches?

- Kasprak, A., Hough-Snee, N., Beechie, T., Bouwes, N., Brierley, G., Camp, R., Fryirs, K., Imaki, H., Jensen, M., O'Brien, G., Rosgen, D., & Wheaton, J. (2016). The blurred line between form and process: a comparison of stream channel classification frameworks. *PloS One*, 11(3), e0150293.
- Coherence in space and time
- Open-ended, non-prescriptive – a flexible learning tool ... allows rivers to speak for themselves ... there is no magic number of river types
- Process-based – channel and floodplain geomorphic units
 - Get your head out of the channel
 - Channels and floodplains tell different stories
 - Not every river has a channel

Stage 1. Respect Diversity – River patterns and connectivity at the catchment scale

Distinguishing characteristics at the reach scale (River Reach Analysis; Kellerhals et al., 1976)

Character and behaviour; Geomorphic units (Fryirs & Brierley, 2022)

Forms, rate, capacity for adjustment (sensitivity/resilience)

Bed material, channel geometry, channel planform, geomorphic units (mosaics, assemblages)

Range of variability – low flow, bankfull, overbank stage

Naming convention (Fryirs & Brierley, 2018)

Distinctive rivers in Australia

River diversity in the Pacific NW

Eastern Canada river images

Slaymaker et al. (2020, Fig 3.1)

a. Ottawa River - constrained, straight river

b. River Rouge, Québec - meandering, sand-bed

c. Atorquait River, Nunavut - braided gravel-bed

d. Ekwan River, Ontario
Anabranching (anastomosing)

Mobility of rivers in the Philippines – rivers use their space in different ways

Wandering gravel-bed river: Abulug River

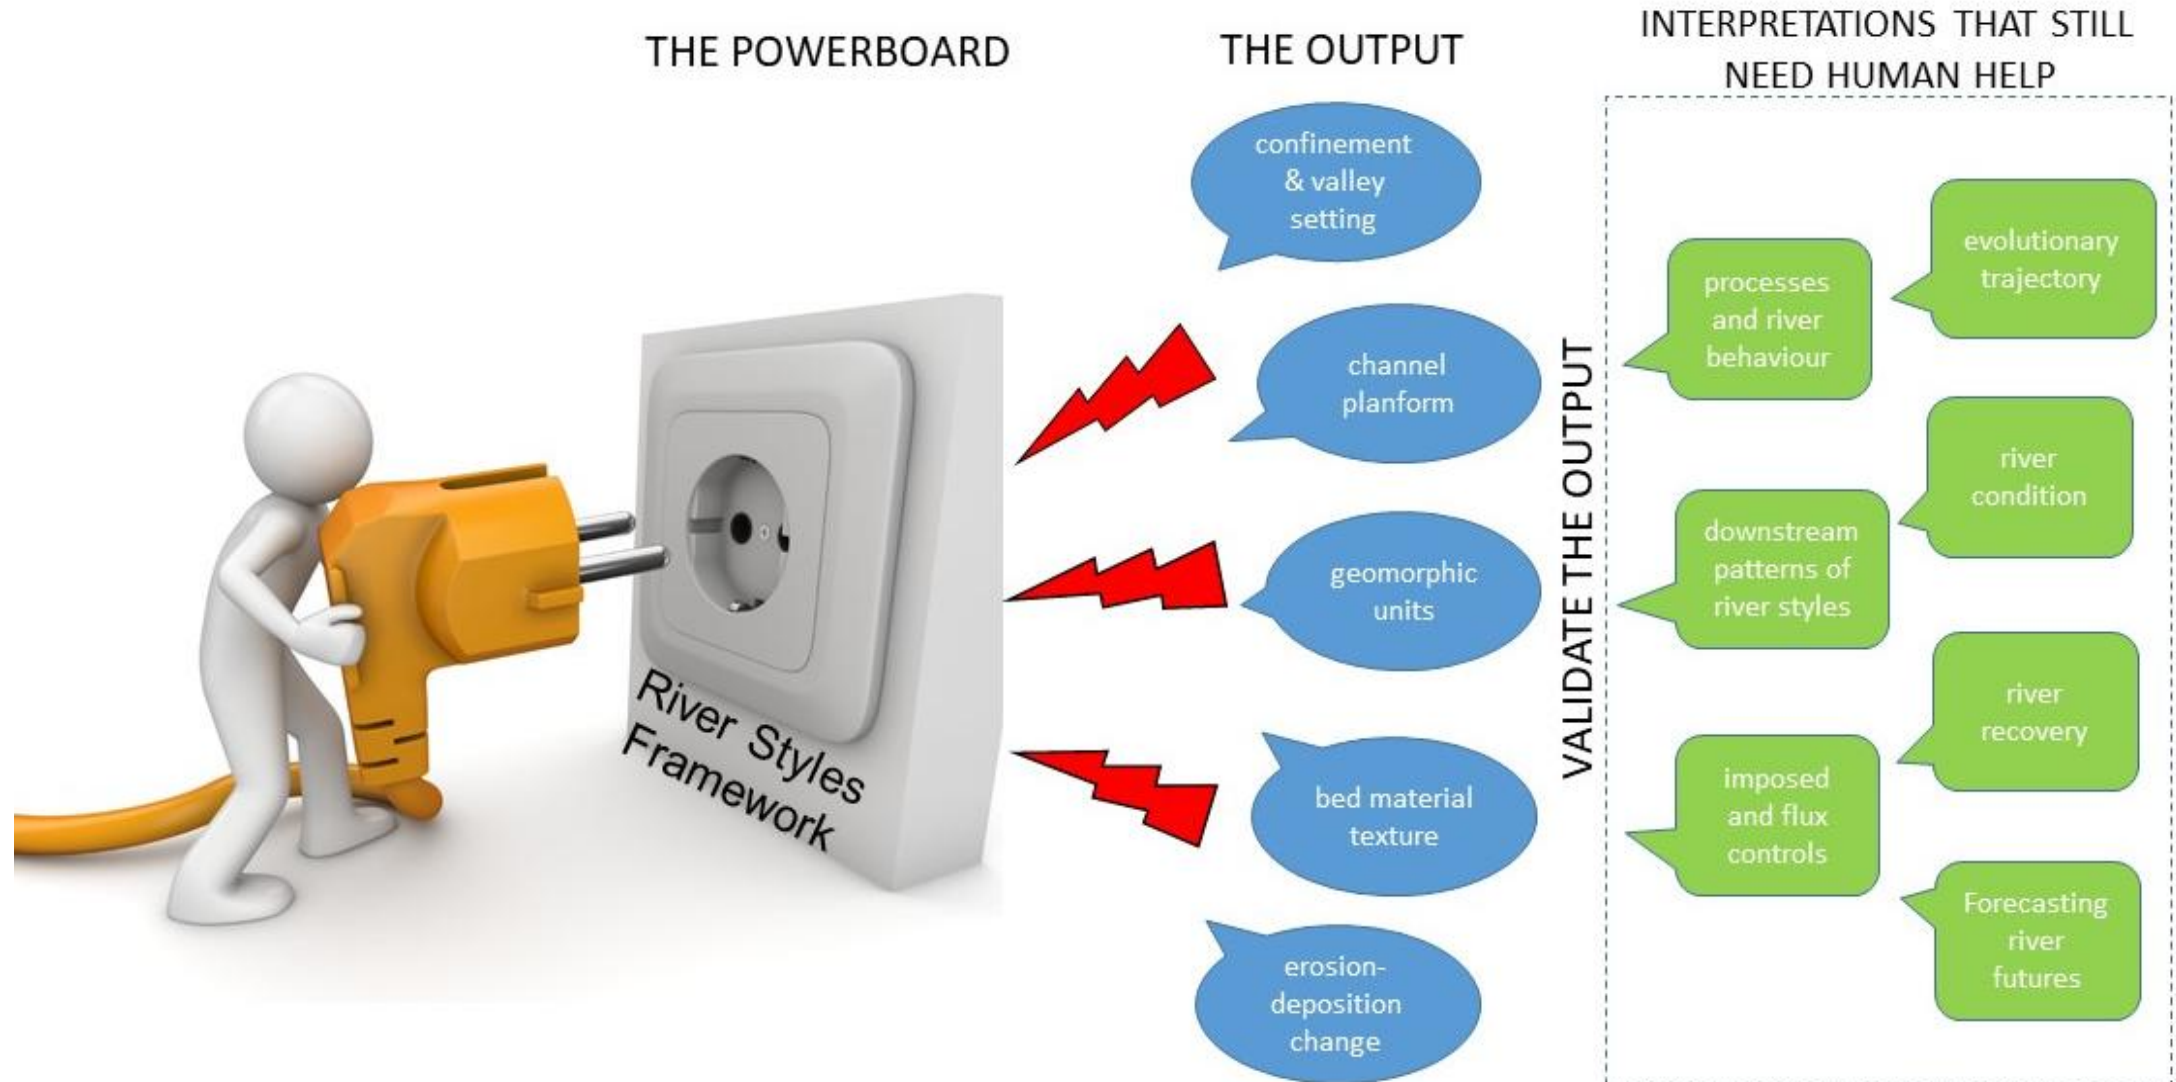

Active meandering river: Cagayan River

Automated mapping

Analysing river character, behaviour, pattern and controls in an era of big-data acquisition and automation (Fryirs et al., 2019)

Multiple knowledges: Make best use of best available understandings

Justice Crombie –
Toronto Waterfront

Stage 2. Evolution & Condition assessment

What is a healthy river?

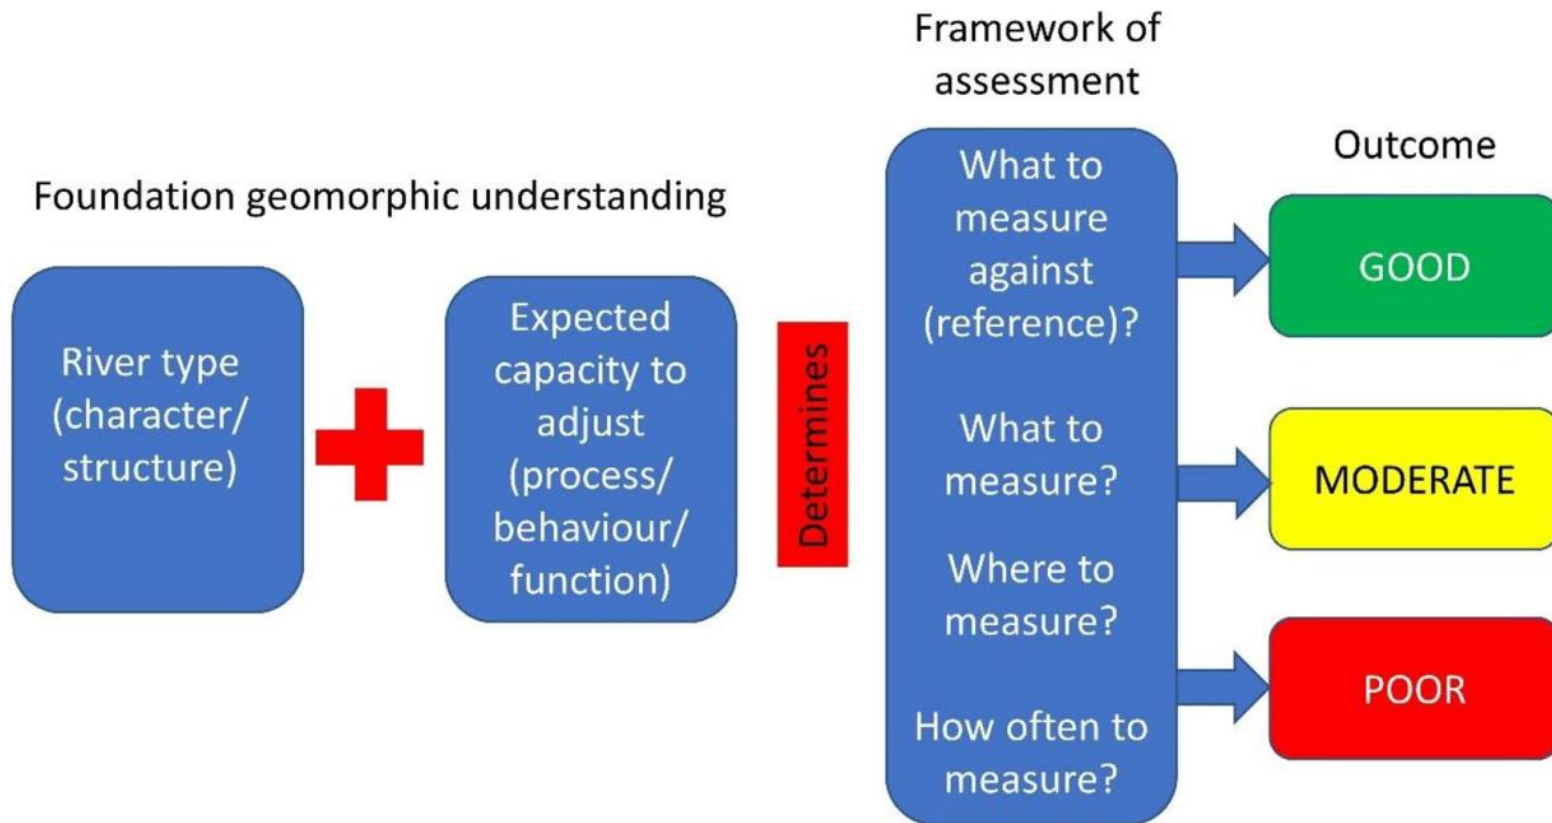

Principles of river condition assessment (Fryirs, 2015; Glassic et al., 2025)

- Compare like with like, carefully considering what you measure against (e.g., range of variability, before/after a flood)
- Measure the right things in the right way, in the right places, at the right time
- Use process-based geoindicators that provide a reliable and relevant signal for the river type under investigation

Premise: The river simply wants to be a river ...

- Erosion recreates and regenerates the physical habitat mosaic of a river. Erosion and deposition are good things in the right place, at the right rate, at the right time
- Floods drives river adjustment (and recovery). Some rivers are attuned to extreme events (non-equilibrium relations), others to more frequent, lower-magnitude flows

Brierley & Fryirs (2022) Fig 5: Approach to assessment of geomorphic river condition

- Rivers are disturbance-driven & dynamically adjusting
- What's good in one may be bad in another
- Need to understand system state (when was the last flood?)
- What is the river type & character and how is it expected to adjust?
- Determines reference condition & measurement parameters for management

Good and poor condition examples of a braided river in the Philippines

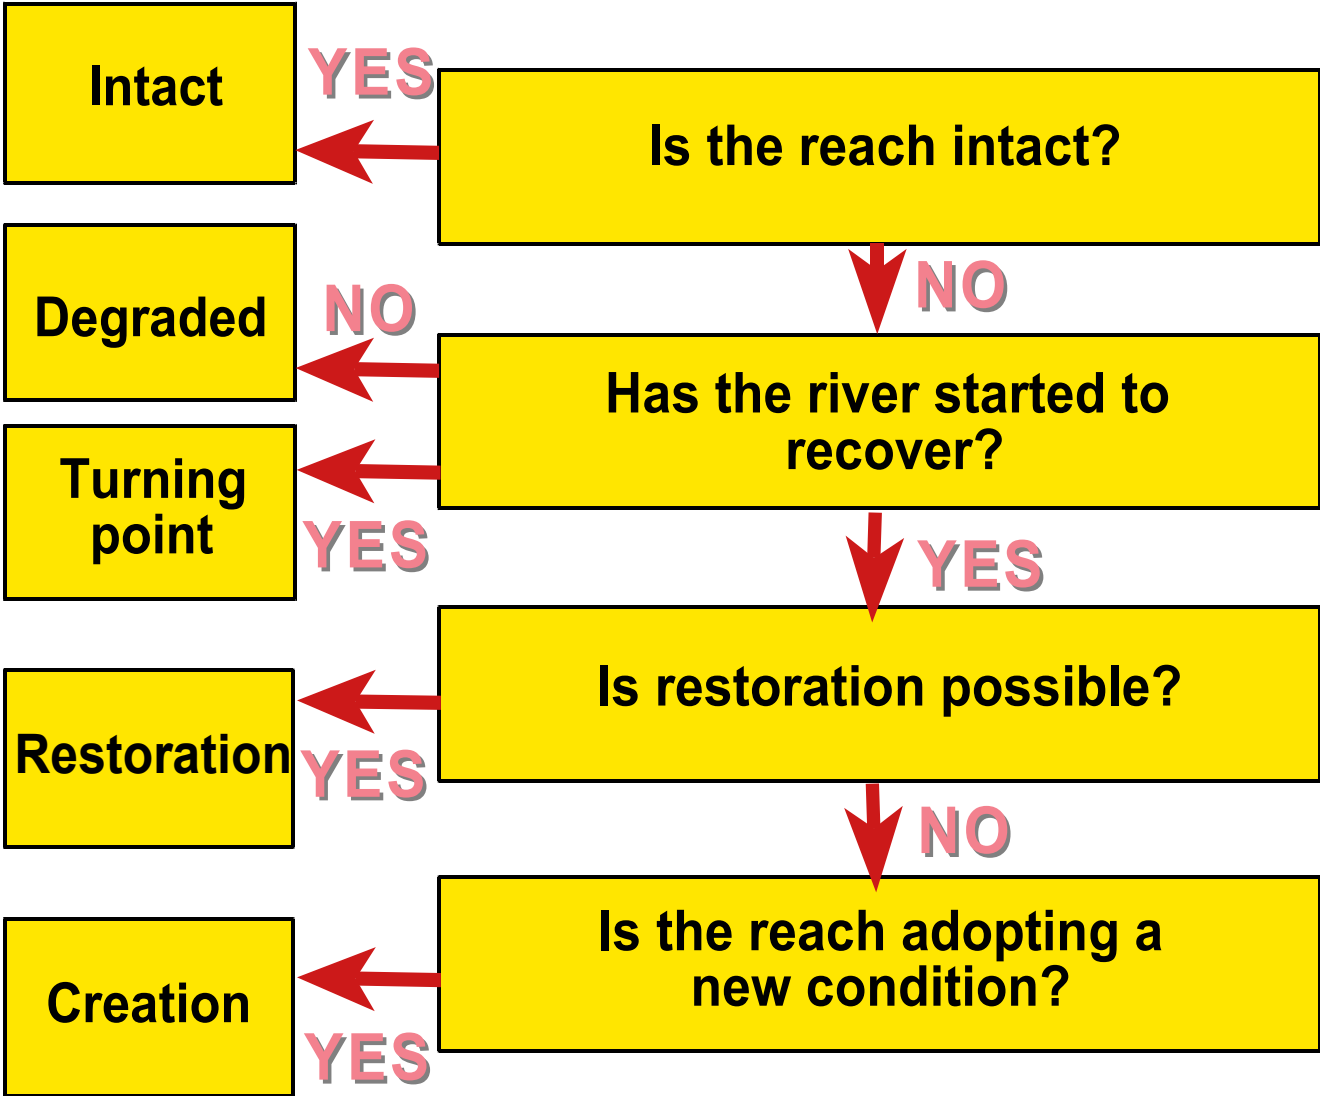

Good and poor condition examples of a meandering river in the Philippines

Measuring the wrong things in the wrong way in the wrong places will never allow us to determine whether the condition of the river and the effectiveness of management practices are improving or not

Stage 3. Recovery – What is realistically achievable?

The River Recovery Diagram (Fryirs & Brierley, 2016)

Geomorphic unit indicators of river recovery (Fryirs et al. 2018, LDD)

Well vegetated, stable benches

Wolumla Creek @ South Wolumla Rd Source: K. Fryirs

Re-emergence of bedrock pools

Cross-scalar applications of the River Styles database (Fryirs et al., 2021)

Scale	Applications
Site/reach	Type of river and its behaviour (geo-eco-hydrology) Link to local values
Sub-catchment & Catchment	Don't fight the site – frame each reach in its catchment context Address threatening processes Minimise negative onsite & offsite impacts Transfer contextualised reach-scale understandings and applications
Regional (state, territory)	Integrate and align decision-making across disciplines and agencies Transfer contextualised catchment-scale understandings and applications Prioritise activities for strategic and efficient use of resources and optimal return on investment
National	Whole-of-Government (and non-government) programmes State of Environment reporting Situate local, catchment and regional conservation and rehabilitation goals in context of national priorities
Intercontinental	Cross-comparative framework Meet UN Sustainable Development Goals, Ramsar convention, etc

NSW River Styles database

River styles in NSW

A consistent method to characterise the types of rivers.

[Home](#) > [Surface water science](#) > [Monitoring changes in surface water environments](#) > [River styles in NSW](#)

Rivers are diverse in their physical character and behaviour. Different types of rivers have different processes and sensitivity to change. To manage rivers effectively, we need to understand the existing geomorphic condition of the river, its inherent fragility (sensitivity to change) and likelihood of recovery. This all requires a consistent method to characterise the types of rivers we are working with and how they function.

River styles framework

The [River Styles Framework](#) is a system for understanding and managing rivers in all their diverse geomorphic characteristics and behaviours. Developed at Macquarie University, the framework is a method for classifying river character, behaviour, condition and recovery potential. It has been used extensively in Australia and overseas to categorise river types and describe river behaviour. The NSW River Styles Database uses the River Styles Framework.

NSW River styles database

The department and Macquarie University have together developed the State-wide NSW River Styles Database. The database is the largest and most comprehensive dataset of geomorphic river character and condition available in Australia. It serves as a decision support tool for integrated river management.

Rivers in New South Wales display a broad range of physical forms and processes. Their form, or character, is a result of many factors including their position in the landscape, geology, land use (both current and historical), runoff and streamflow (amount and variability), sediment dynamics and vegetation. Understanding the processes and responses, or behaviour, of these systems, allows us to develop ways to support and improve riverine health. Healthy rivers are critical for the plants and animals that live there, but also have important cultural, social and economic value.

River Styles is a framework developed at Macquarie University that describes the physical characteristics and diversity of rivers and assesses geomorphic stream condition. It considers their capacity to adjust, sensitivity to change due to disturbance, and the pressures (natural and human) that affect their geomorphic condition. It further considers whether a river reach is likely to improve its geomorphic condition over a reasonable timeframe (normally decades) if left alone and provides guidance to help with the prioritisation of river management activities on a conservation-first basis.

The [New South Wales River Styles companion document](#) provides an explanation of the dataset and the River Styles framework.

The following web map services are available to add to your own Geographic Information System:
[NSW River Styles ESRI Map Service](#)
[NSW River Styles ESRI Feature Service](#)
 NSW River Styles is also available on [SEED](#)

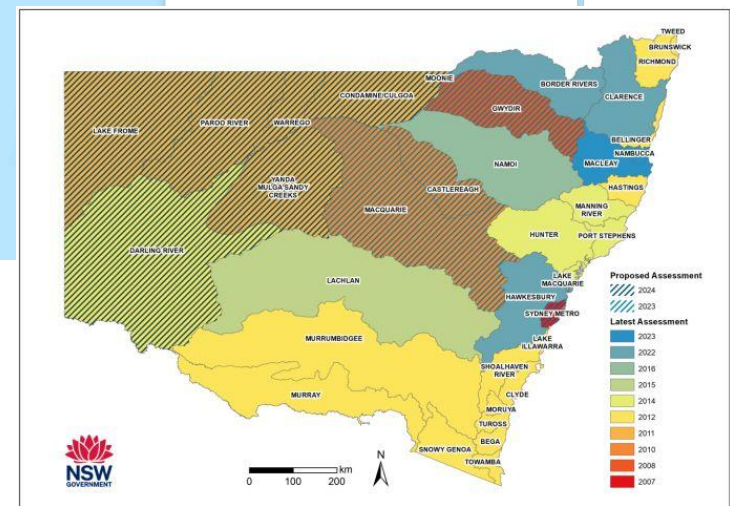

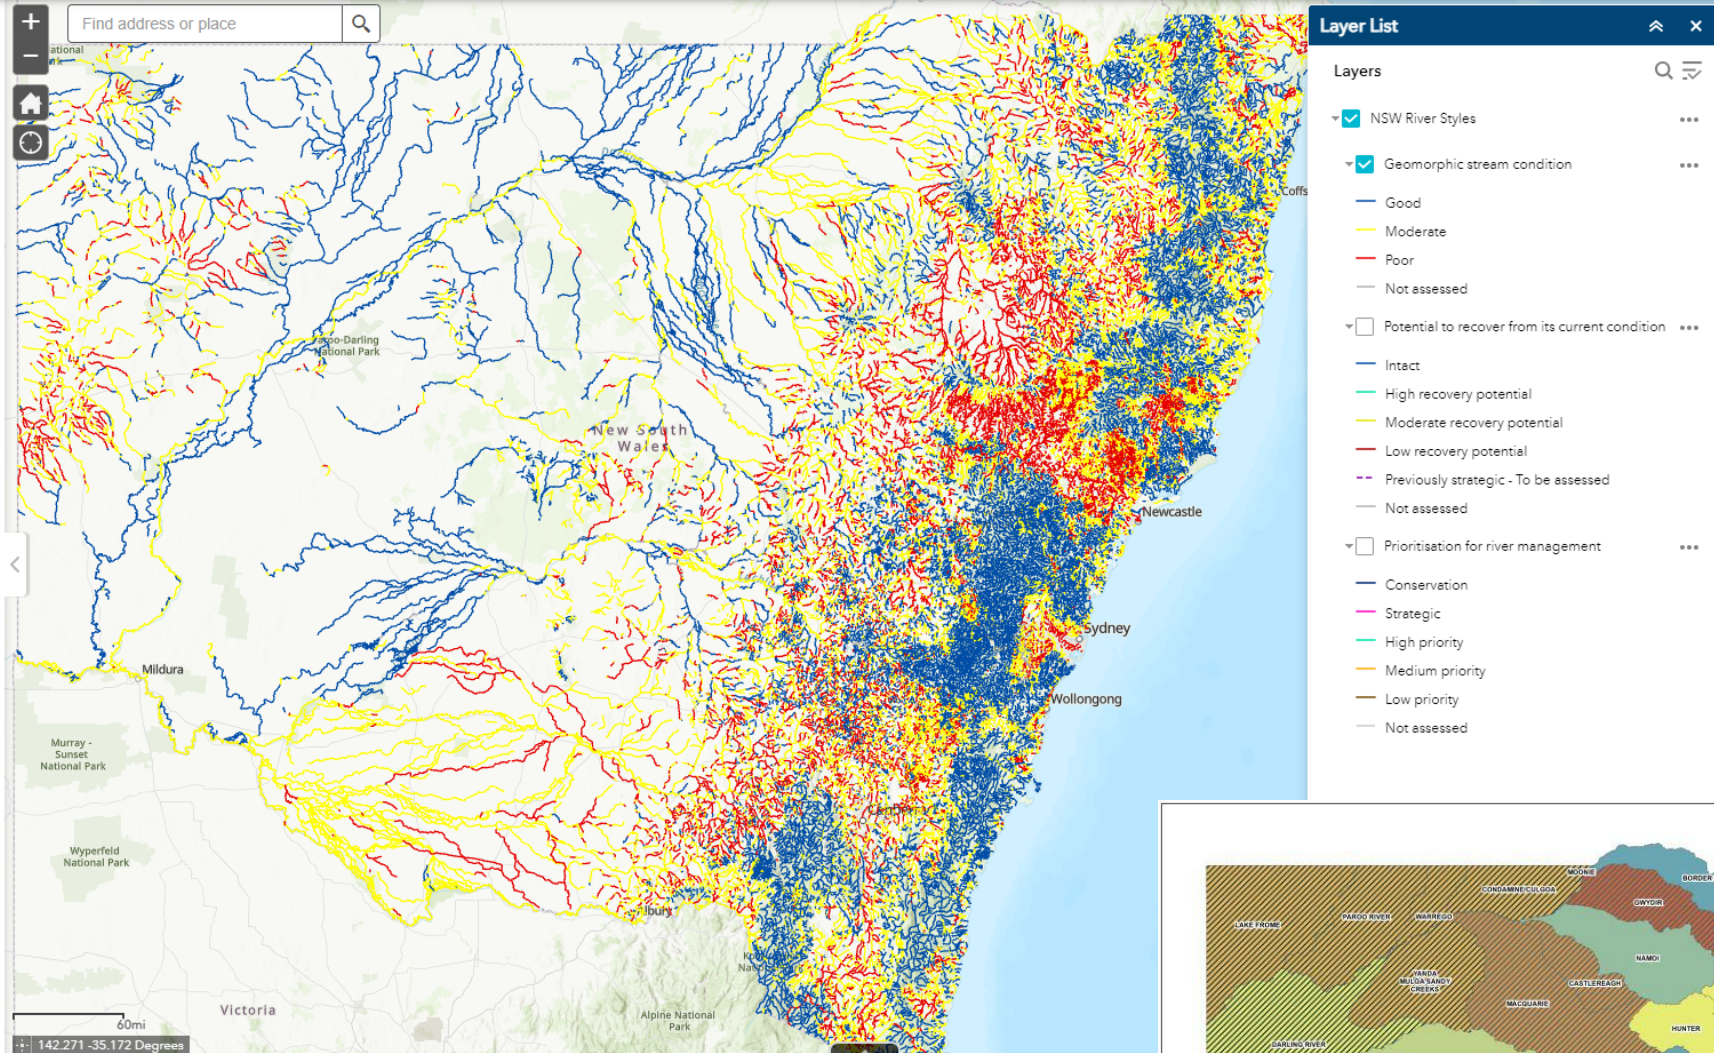

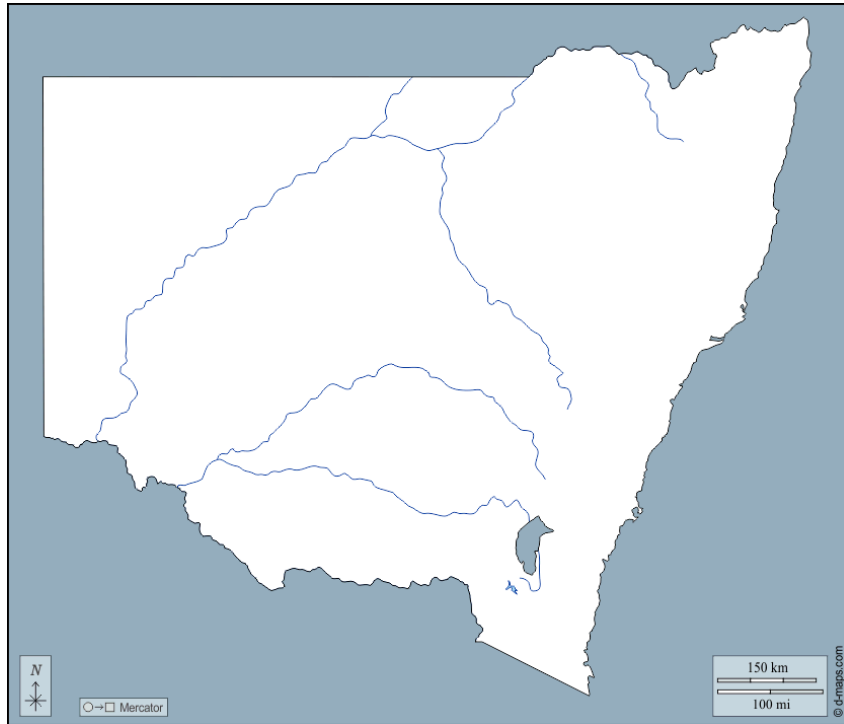

Figure 2. Status of state-wide River Styles assessments. The angled line shows the dates for proposed assessments.

Ontario is 25% larger than New South Wales

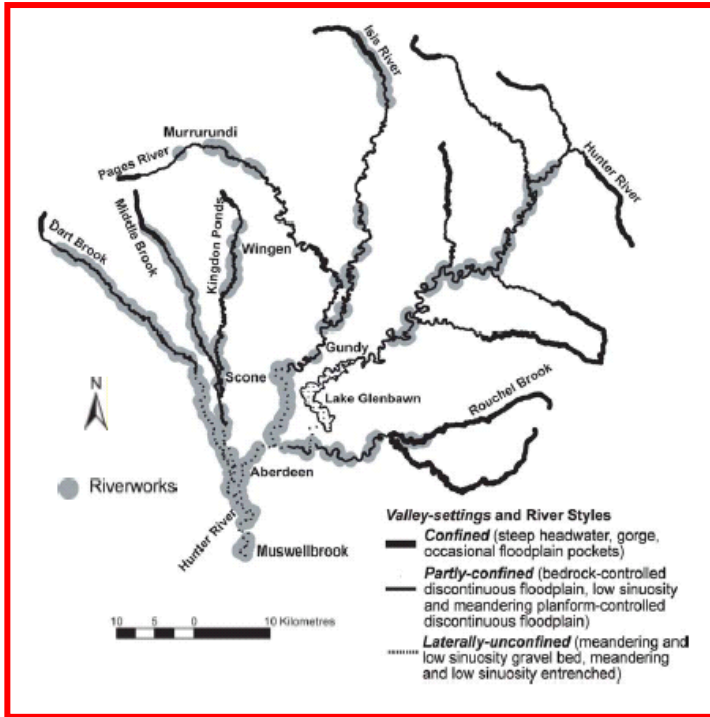

New South Wales: 800,642 km²

Ontario: 1,076,395 km²

Stage 1 Applications: Tailoring on-ground actions to River Style character and behaviour – choosing the right tools for the job

Upper Hunter – 517 riverworks installed since 1950 on almost every river course (Spink et al., 2009)

- In the past, same types of works applied to different types of river and different forms of river adjustment
- Lack of understanding of causes (bed instability) and recovery potential of reaches
- Now designing river-type appropriate plans and structures that work with style, condition and recovery potential

Stage 2 Applications: Identifying expected reference reaches for monitoring and evaluation

Measuring or monitoring condition indicators at appropriately contextualised reference reaches for each River Style in NSW

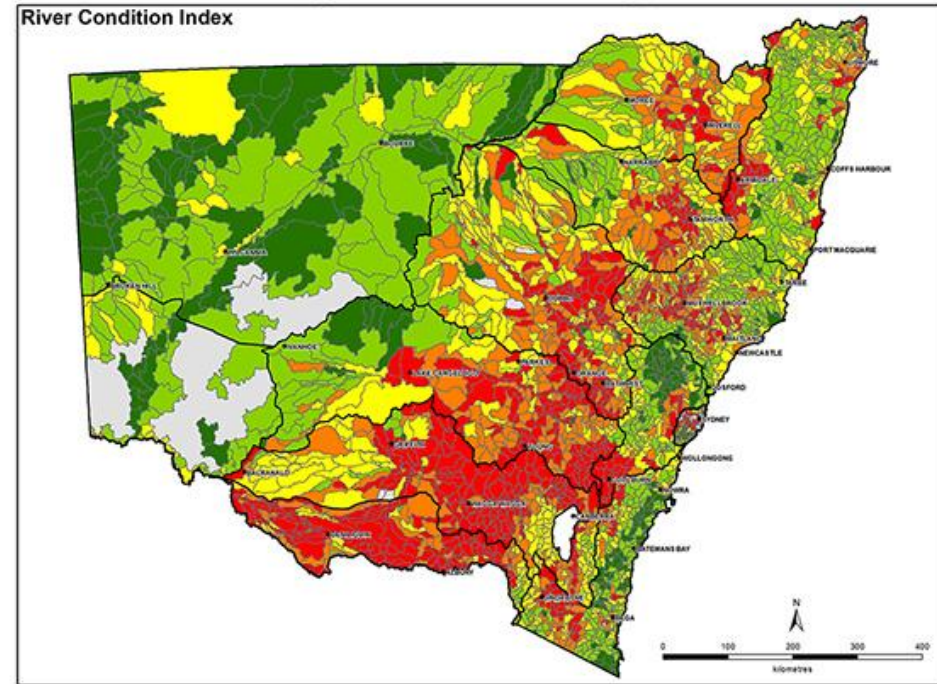

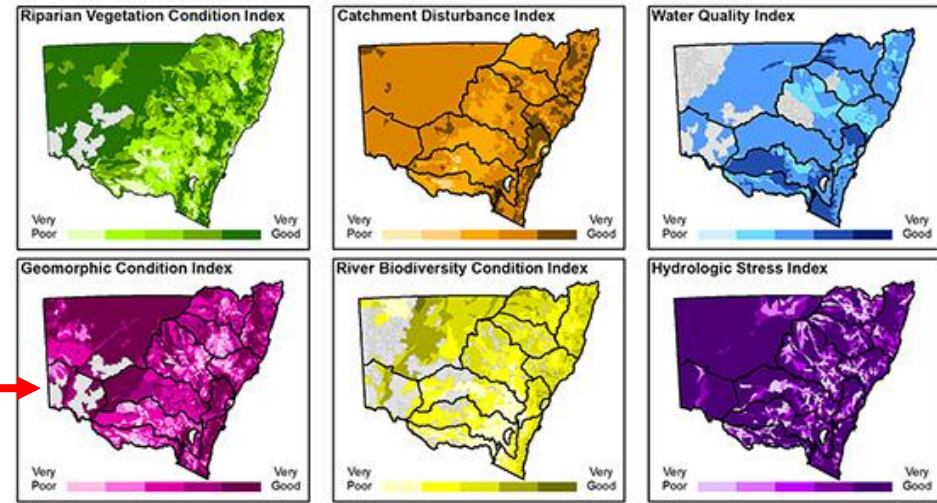

Low sinuosity cobble bed

Wandering gravel bed

Stage 2 Applications: NSW River Condition Index

River Styles
Stage 2
condition

RIVER CONDITION INDEX AND INPUT INDICES

Map produced by DPI, 18th January 2013

State- and region-scale bioregional assessments

Identifying the right problems to treat (limiting factors), and what to leave alone

Framing geomorphology alongside:

- Riparian vegetation condition
- Catchment disturbance
- Water quality
- River biodiversity
- Hydrologic stress

Stage 2 Applications: Using condition to define targets for river rehabilitation (Confined, bedrock margin-controlled, occasional floodplain pockets, sand bed)

Moderate condition

- Weed management in channel and on floodplain
- Encourage continuous endemic riparian zone
- Enhance pool re-emergence
- Encourage wood accumulation

Good condition

Poor condition

- Plant riparian vegetation with natives
- Reduce exotic vegetation coverage
- Reduce sediment input
- Re-emergence of bedrock and pools

Moderate condition

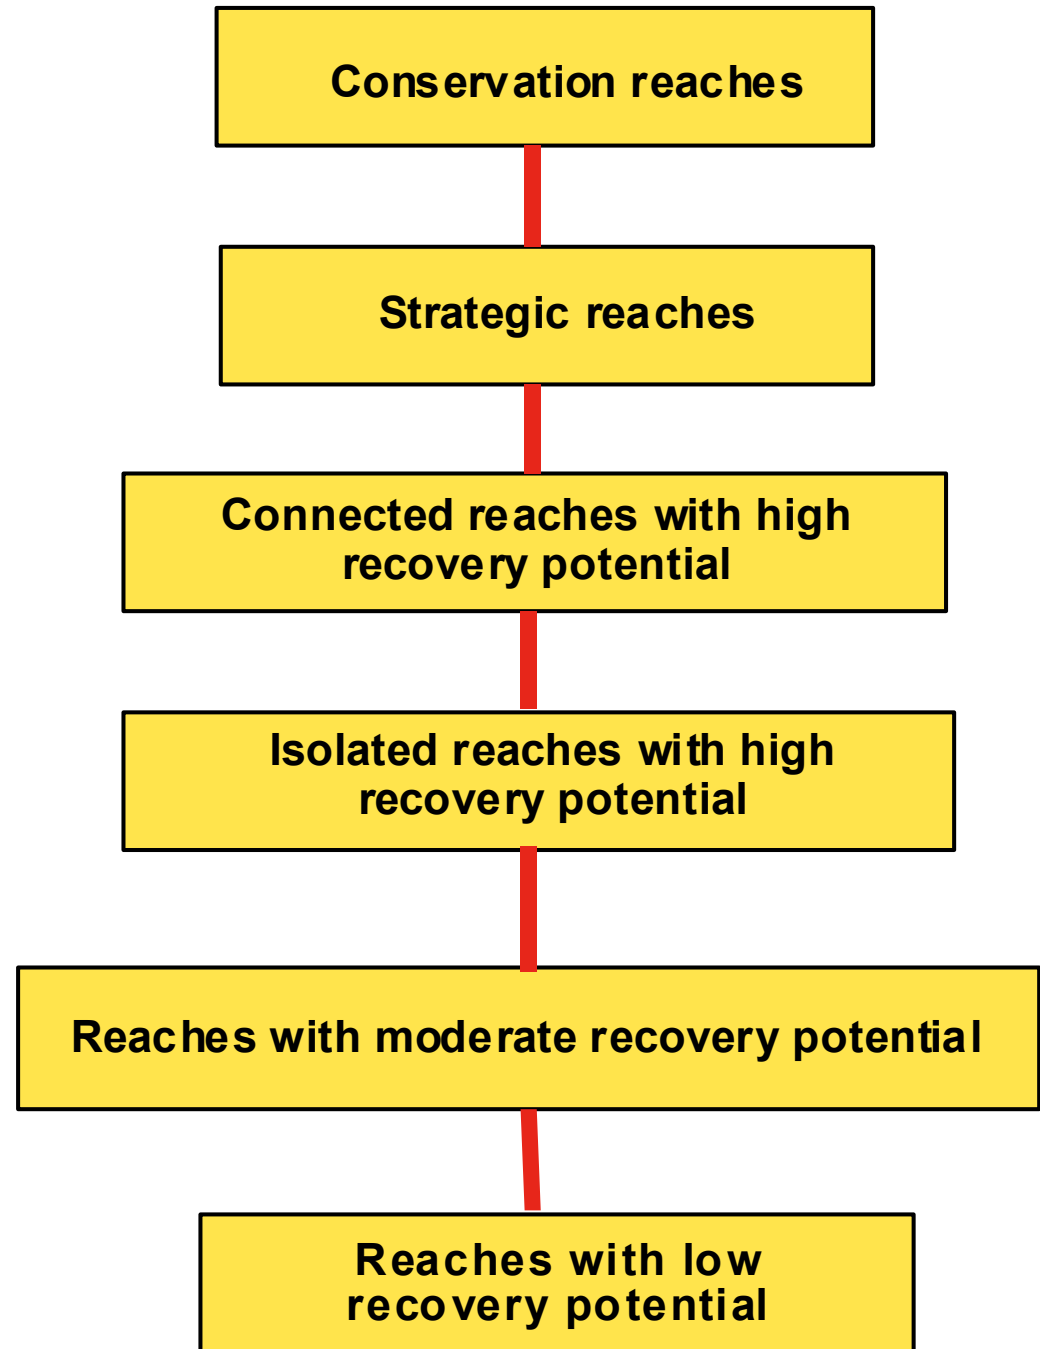

Stage 3 Applications: Prioritisation of river conservation and rehabilitation based on recovery potential

Conservation first: Look after the good bits and unique attributes

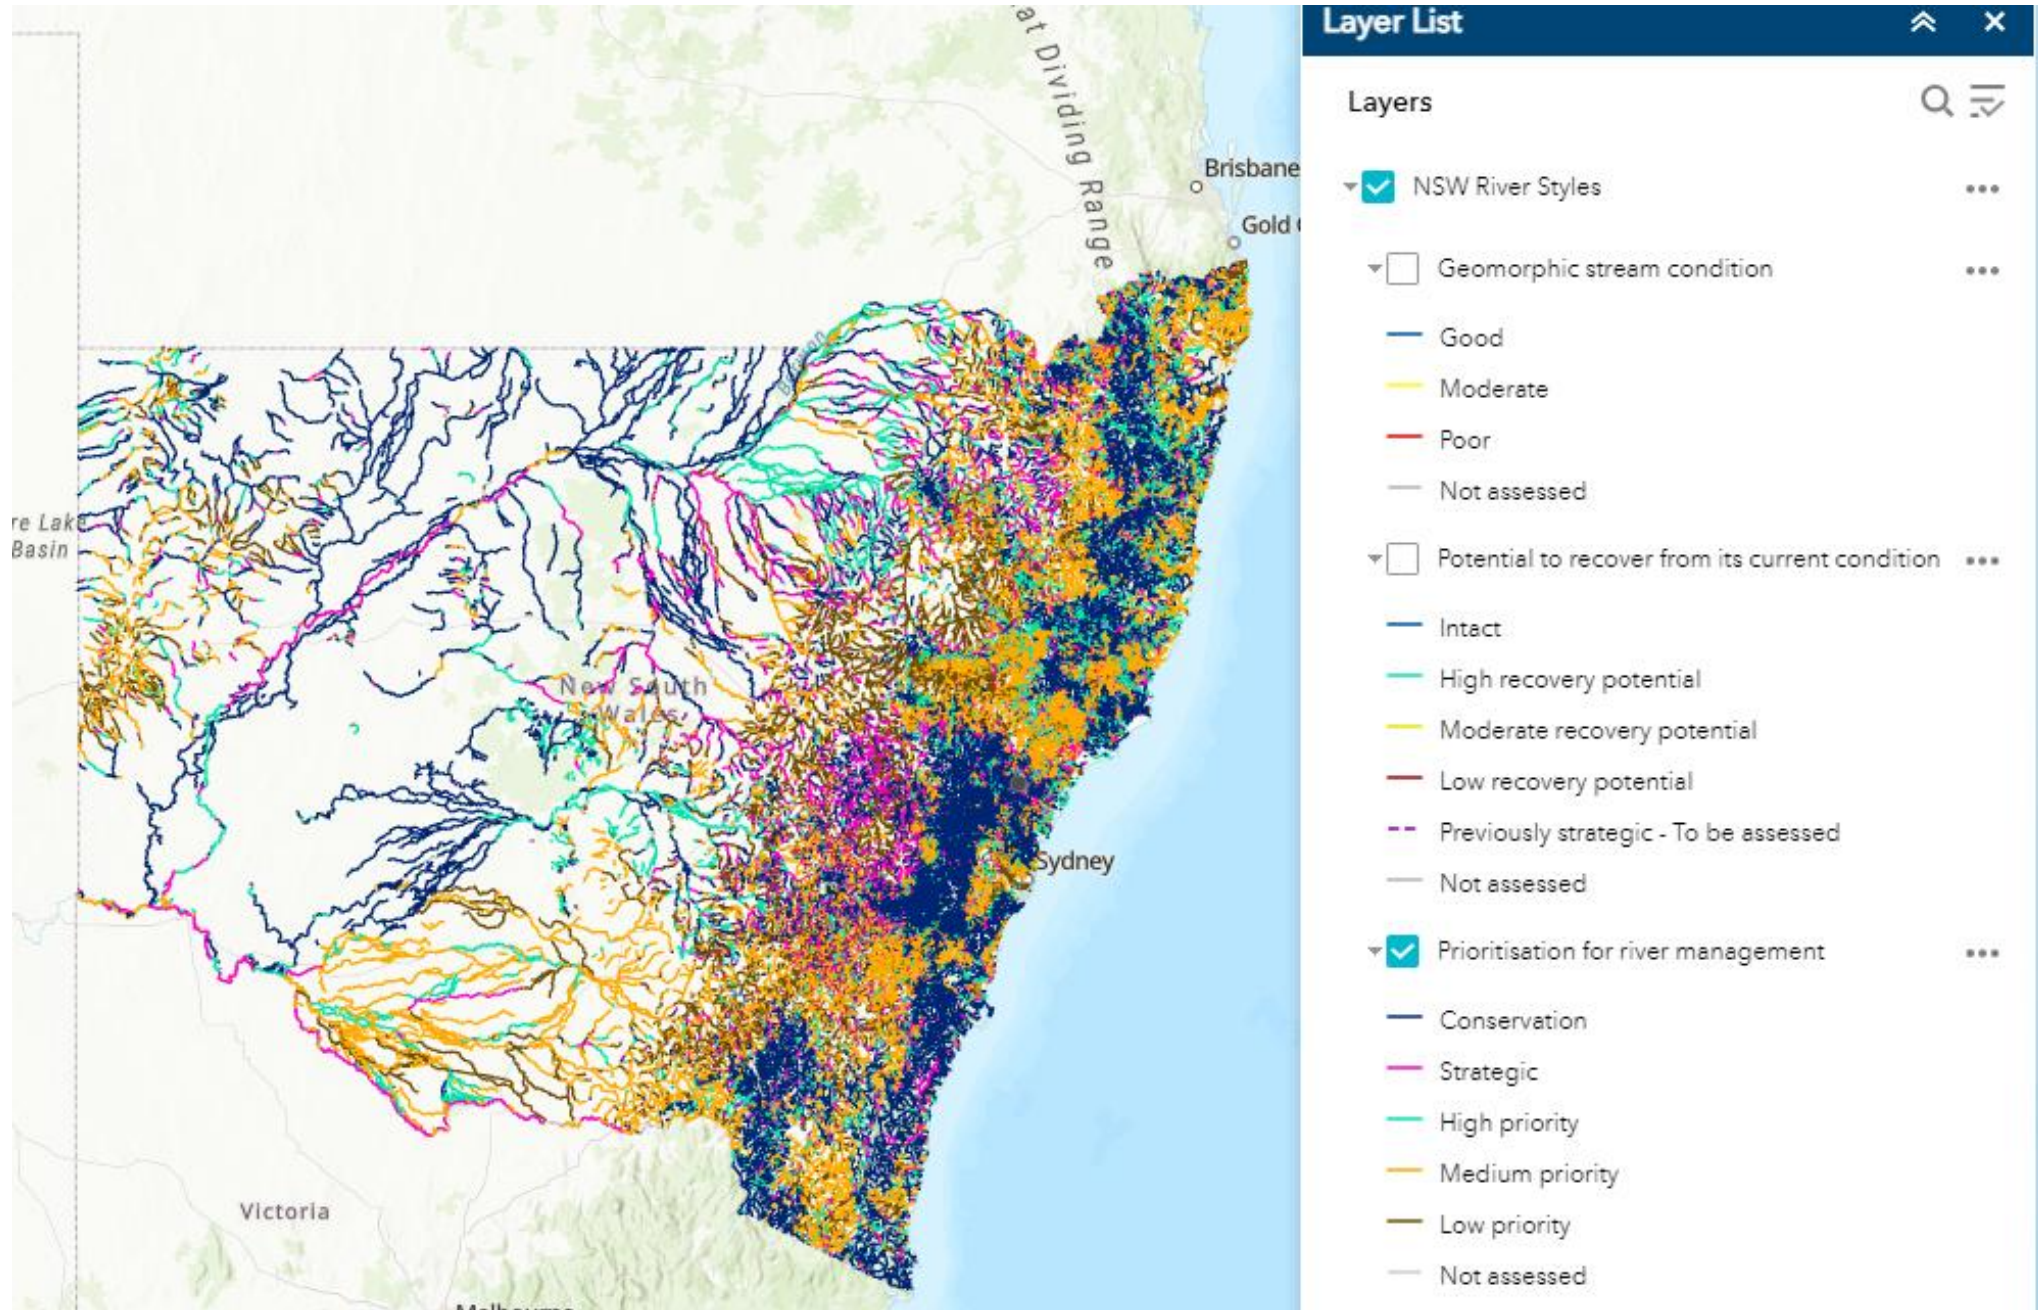

Don't fight the site (Brierley & Fryirs, 2009)

Target key problems & threatening processes in a strategic (proactive) manner – identify and rectify problems (causes, not symptoms)

Minimise off-site impacts - Link reaches to enhance prospects for sustainable success (e.g. consideration of sand slugs, head cuts, etc)

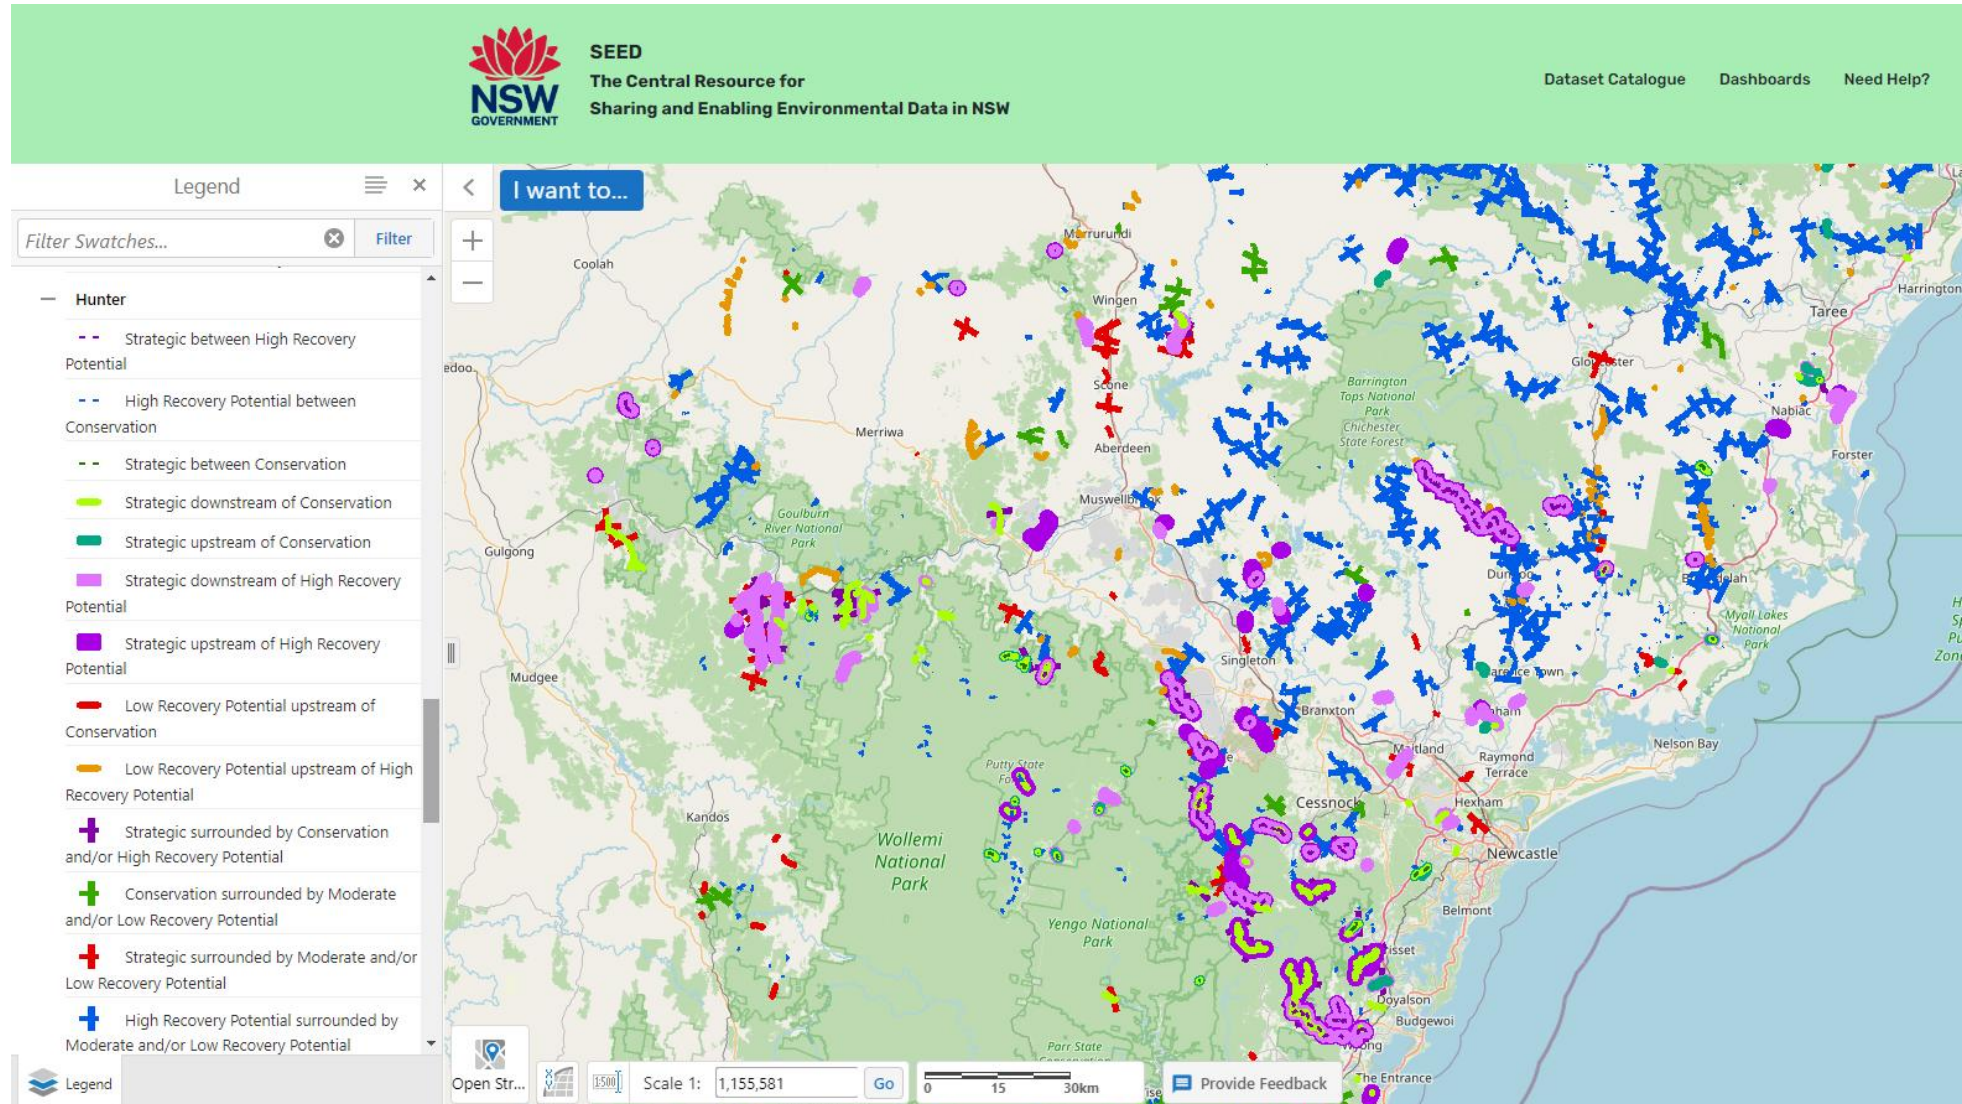

Stage 3 Applications: Prioritization based on recovery potential

Stage 3 Applications: Prioritizing riparian corridor revegetation for Natural Flood Management (Agnew & Fryirs, 2022)

SEED portal: <https://datasets.seed.nsw.gov.au/organization/macquarie-university>

Geomorphology informs water management decision making

New South Wales water planning and Commonwealth reporting

- Defensible, evidence-based categorisation and prioritisation of reach to catchment scale type, state and condition
- Accountability for how status, assessments and rules are determined
- Collaborations across DPI Water & external agencies (OEH, DPI Fisheries, LLS, Soil Conservation Service, Cwth Dept Environment, MDBA)
- Targeted management of water extraction stress

Sloanes froglet

Booroolong frog

Davies tree frog

- To assess distribution and status of fish communities at the reach scale
- Support strategic planning frameworks to ensure integration of biodiversity considerations in planning
- Monitor improvements in habitat condition and status

Dataset: Macquarie Perch Indicative Distribution in NSW

Changing perspectives ... Let the river do the work ... just help it along by enhancing recovery

2022 NSW GOVERNMENT INDEPENDENT FLOOD INQUIRY

Recommendation 20 – Floodplains as an asset (p30)

- consider “floodplains as an asset” including “letting watercourses largely flow naturally rather than implementing engineering barriers such as flood levees and mitigation schemes to stop floods”
- reconsider land use planning and all development on floodplains.

Recommendation 27 – Environment (p36)

- specifies the need to “develop an Indigenous led cultural landscape restoration strategy....for nature-based flood mitigation and adaptation which would see large-scale native revegetation and wetland restoration”, starting in the Northern Rivers region.

Moving forward together: Collective wellbeing – Inclusive, shared approach to learning

Place-based, catchment-specific applications (Bioregionalism) ... Grounded applications that 'keep it real' (cf., Digital worlds & AI)

Herman Hesse (1951) *Siddhartha*, p105

"The river has taught me to listen; you will learn from it, too. The river knows everything; one can learn everything from it."

Freya Mathews (2023) The Dao of Civilization, p52

“In wending its way thither and thereby achieving a destination proper to its nature, it (the river) simultaneously assists others in achieving their ends, sustaining the entire landscape with its waters, giving life to all things. ‘Doing nothing’ then, the river ensures that everything is done, that its work of sustaining the world is accomplished.”

Closing thoughts

Changing practices in the conduct and use of geomorphology ... working with the river

- Let the River Speak (Listen to the river & learn from it)
- Beyond management: (Re)learning to live generatively with living rivers

The River Styles Framework provides an organizational tool to support coherent, proactive geomorphologically-informed management applications

- Maximizing prospects of AI & Big Data
- Local knowledges, local relations to rivers ...

How effectively do contemporary management practices ‘work with the river’ in Ontario?

Thanks ...
